Practical Title: Student Management CRUD with Search and Filter Problem Definition: Create a student management module to add, view, edit, delete, search and filter student records. All database operations must use MySQL i statements and clear success/failure messages.

Theory :

1. Are SELECT, INSERT, UPDATE, and DELETE operations working?
Yes. INSERT adds a new student record, SELECT displays all student records in a table, UPDATE edits the selected student record using an edit form, and DELETE removes a student record. All operations use MySQLi prepared statements, and a success or failure message is shown after each operation.

2. Is search by name/email/course implemented?
Yes. A search box sends the keyword using the GET method, and the SELECT query uses LIKE to match the name, email or course. A course dropdown is also provided for filtering using a WHERE condition, and search and filter can work together.

3. Are delete operations confirmed before execution?
Yes. When the user clicks the Delete button, a JavaScript confirm() dialog asks "Are you sure you want to delete this student?". The record is deleted only when the user clicks OK. Otherwise nothing happens.

Student Management
