PRACTICAL-14

Practical Title: Admin Dashboard with Role-Based Access Control, Dynamic Menu, and Audit Log.

Problem Definition: Develop an admin dashboard that displays user statistics, student count, event count and latest registrations. Restrict access to admin users only and show dynamic menu options based on role.

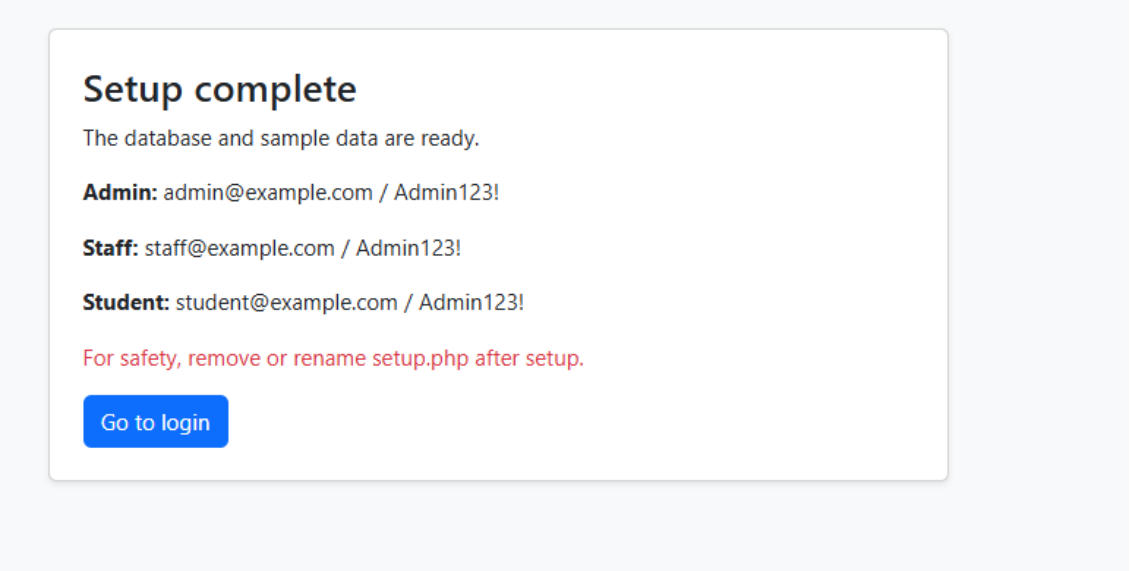

Theory :

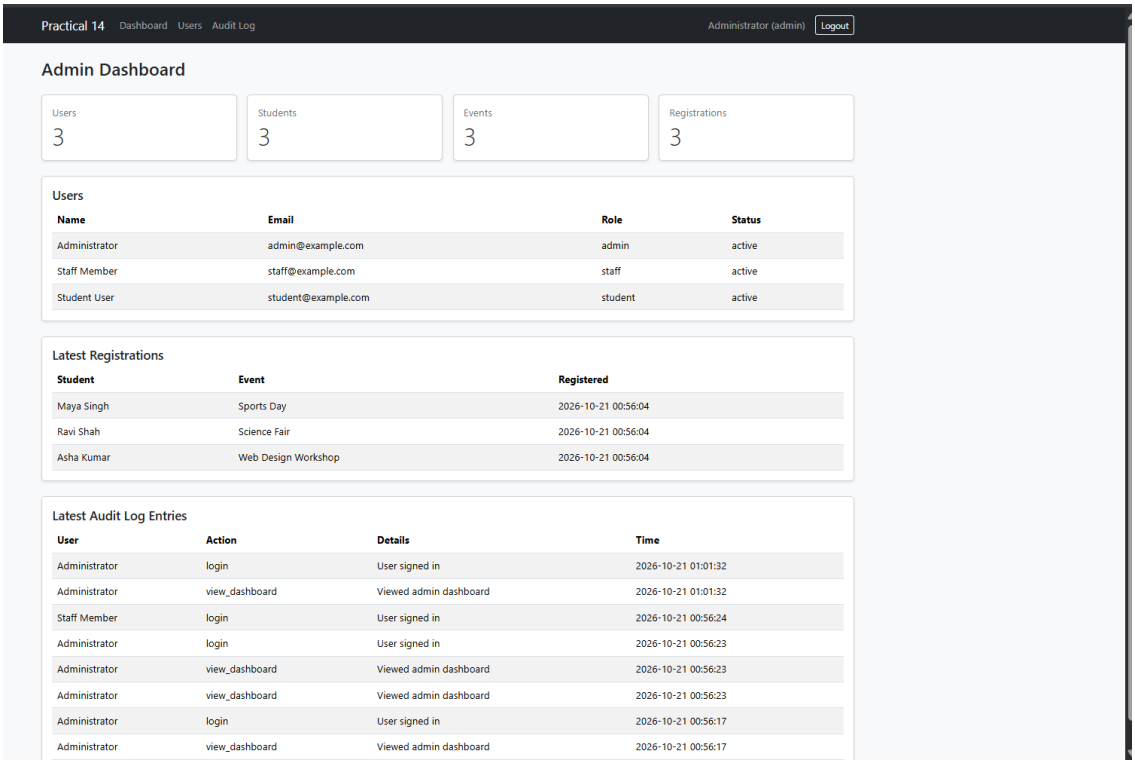

1. Are dashboard values loaded dynamically from the database?
Yes. The user count, student count and event count are taken using SQL aggregation queries such as SELECT COUNT(*). The latest registrations are taken using a JOIN of the registrations, students and events tables with ORDER BY and LIMIT. No value is written manually in the code.

2. Is access restricted to admin users?
Yes. At the top of the dashboard page, the session is checked for a logged-in user and the role must be admin. If not, the user is redirected to the login page or shown an access denied message.

3. Are role-based menus working?
Yes. The menu is created in PHP according to the role saved in the session. Admin users see options such as Dashboard, Manage Students, Manage Events, Users and Audit Logs, while student users see only options such as Profile, Events and My Registrations.

4. Are important admin actions recorded in audit_logs?
Yes. An audit_logs table stores the user id, action, details, IP address and date-time. A common function is called after important actions such as login, adding, editing or deleting students and events, and changing user status, so every action can be traced.

Setup complete
The database and sample data are ready.
Admin: admin@example.com / Admin123!
Staff: staff@example.com / Admin123!
Student: student@example.com / Admin123!
For safety, remove or rename setup.php after setup.

H. Learning Outcomes:
I am able to build a role-based admin dashboard with basic monitoring and traceability.
